

Below are **20 “Posh-style link” promotional patterns** for WeUP—meaning: every share is a **trackable, textable, single-tap deep link** (like Posh’s tracking links + SMS blasts that attach the event link/flyer and let you measure clicks → revenue). ([Posh Support](#))

They’re designed to respect WeUP’s core constraints: **invite-only tiers** and **no infinite feeds / no endless scroll** .

MVP Phase (ship-now mechanics that still feel “alien”)

1) Link-As-A-Flyer (LAF)

- **What:** Every WeUP link renders a mobile flyer landing with *one* CTA: **Buy / RSVP / Request Invite**.
- **Tier use:** Tier 1+2 links can include invite claim; Tier 3 links are view-only + “request invite.”
- **Actionable:** Generate share links per promoter + per channel; attach flyer image automatically (Posh-style). ([POSH](#))

2) “Text-to-Ticket” Ladder

- **What:** One link supports **3 escalating actions**: *View flyer* → *Hold ticket (timer)* → *Buy*.
- **Tier use:** Tier 2 gets “hold priority”; Tier 1 can extend hold windows.
- **Actionable:** SMS templates + short links + click/revenue attribution (like Posh tracking links). ([Posh Support](#))

3) Invite-Lineage Link Credits

- **What:** The link itself is a **lineage object**: “who invited you” becomes measurable and rewardable.
- **Tier use:** Tier 1 seeds Tier 2; Tier 2 seeds Tier 3; Tier 3 can’t seed—yet.
- **Actionable:** Give each Tier 2 ambassador a unique link; show them *their branch* conversion.

4) “Host-Verified” Micro-Ads (No Feed Required)

- **What:** Ads only exist as **opt-in, event-scoped boosts** inside explicit intent flows (search / map filter results).
- **Tier use:** Only Tier 1 hosts can create boosts; Tier 2 can earn boost credits.
- **Actionable:** Sell “boost slots” that appear only when a user is actively seeking plans (aligns with no-feed).

5) QR-to-SMS Bridge

- **What:** Flyers/door signage QR doesn't just open a URL—it triggers “**text me the link**” so the link persists in the user's messages thread.
 - **Tier use:** Tier 2 street-team can distribute QR cards; Tier 1 controls the master QR.
 - **Actionable:** Door poster QR → opens “Text me my ticket link” (Posh explicitly pushes QR+SMS event URLs). ([Posh Support](#))
-

Phase 1 (community leverage + presence-first commerce hooks)

6) Attendance-Receipt Unlock Links

- **What:** Your ticket link “mutates” after check-in: it unlocks **post-check-in content** (merch, afterparty location, secret set times).
- **Tier use:** Tier 1 can create receipt-locked drops; Tier 2 distributes “unlock links”; Tier 3 earns them by showing up.
- **Actionable:** QR check-in issues a receipt; shop/items appear in real time.

7) Lineage-Locked Drops (the anti-scalp flex)

- **What:** A drop is visible only to a **specific invite branch** (ex: “everyone invited by DJ X's ambassadors”).
- **Tier use:** Tier 1 defines lineage predicates; Tier 2's branch becomes a mini-culture cell.
- **Actionable:** Great for limited tickets, merch, or “backstage” access—without public hype spam.

8) “Quiet Power” Tier Unlock (no shaming UI)

- **What:** Users don't see “locked” items greyed-out. They simply see **new things appear** when eligible.
- **Tier use:** Tier upgrades feel like reality expanding, not like a paywall.
- **Actionable:** Tier-aware rendering rules in MVP+; WeUP shop doc explicitly calls for this.

9) Two-Hop Collab Share

- **What:** Tier 1 host can mint a “co-host capsule link” for a Tier 2 ambassador: the ambassador can *co-brand* the landing flyer (without editing the event).
- **Tier use:** Tier 2 becomes a sanctioned co-narrator; Tier 3 sees a familiar face.
- **Actionable:** The landing page shows “Hosted by ____ • Brought to you by ____” with split attribution.

10) “Stop-Signal Marketing” (designed scarcity without addiction)

- **What:** Promotions are time-bounded and end cleanly; the UI explicitly signals closure (“this window is complete”).
 - **Tier use:** Tier 1 can open/close promo windows; Tier 2 gets scheduled “push moments.”
 - **Actionable:** Aligns with “no infinite feeds” and “system ends sessions for you.”
-

Phase 2 (map-native virality + ritualized discovery)

11) Map-Summoned Links (location-as-invite)

- **What:** A link doesn’t just open an event page; it opens the **map at the exact locus** with a “fly-in” camera move.
- **Tier use:** Tier 2 links can include “meet me at this pin” anchors; Tier 1 can pin “hidden layers.”
- **Actionable:** Uses WeUP’s interactive map identity.

12) Temporal Windows as Marketing (not dates)

- **What:** Users share *windows* (“the portal opens 9:40–10:10”) and the link is only actionable inside that window.
- **Tier use:** Tier 1 defines windows; Tier 2 distributes them; Tier 3 experiences “happening now” energy.
- **Actionable:** No feed needed—time itself is the discovery surface.

13) “Heatmap Hints” Discovery

- **What:** Instead of listing events, you share an **area of intensity**; users tap the map heat to reveal eligible events.
- **Tier use:** Tier 3 sees general heat; Tier 2 sees sharper contours; Tier 1 sees full layers.
- **Actionable:** Directly aligned with “global visualization + heatmaps + hidden layers.”

14) Sponsor-As-Quest, Not Ad

- **What:** Brands don’t buy banners; they sponsor **missions** (“find the glowing marker; claim a perk”).
- **Tier use:** Tier 2 ambassadors act as quest captains; Tier 3 participates; Tier 1 approves mission placement.
- **Actionable:** Works with real-time map updates and gamification.

15) “Reverse Invite” Waitlist Tuning

- **What:** A Tier 3 user can send a link that doesn’t invite— it submits a **request to be invited by a specific Tier 2 ambassador** (social routing).

- **Tier use:** Tier 2 becomes a curator; Tier 1 sees emergent demand by neighborhood/scene.
 - **Actionable:** Turns “I want in” into a structured pipeline, not spam.
-

Phase 3 (future-weird: privacy, agents, anti-fraud, underground modes)

16) Encrypted Location Reveal Links (Underground Mode)

- **What:** The link reveals the location in stages (or only after check-in time), optionally with cryptographic gating.
- **Tier use:** Tier 1 hosts control secrecy mode; Tier 2 distributes vetted invites; Tier 3 receives time-locked reveal.
- **Actionable:** Matches your roadmap’s underground/event privacy direction.

17) AI “Promoter Ghost” (auto-campaigns without spam)

- **What:** An AI agent schedules micro-blasts only when they statistically matter (weather shift, lineup change, low conversion pockets).
- **Tier use:** Tier 1 configures tone + constraints; Tier 2 opts into auto-campaign assistance; Tier 3 receives fewer, better messages.
- **Actionable:** Roadmap supports AI concierge/assist behaviors.

18) Graph-Verified Link Trust Score

- **What:** Links carry a subtle “trust aura” based on invite-graph integrity (anti-bot, anti-scams), not follower counts.
- **Tier use:** Tier 2’s reputation improves distribution power; Tier 1 can quarantine suspicious branches.
- **Actionable:** Roadmap explicitly calls out graph-based fraud/bot detection.

19) Multi-Host Revenue Split Links

- **What:** One event has multiple co-host links with **automated revenue splits** and per-host analytics.
- **Tier use:** Tier 1 can designate official co-hosts; Tier 2 can be “commission hosts”; Tier 3 just buys seamlessly.
- **Actionable:** Roadmap already describes collaborative co-hosting + split logic.

20) “Culture Cells” Packets (shareable micro-worlds)

- **What:** Instead of “share event,” users share a **cell**: a tiny curated cluster (event + meetup pin + afterthread + shop window).

- **Tier use:** Tier 1 creates canonical cells; Tier 2 spins local variants; Tier 3 experiences guided discovery with stopping signals.
 - **Actionable:** No feed required; everything is event-anchored and time-bounded.
-

If you want to operationalize this fast: implement **WeUP Link Objects** first (short link + inviter ID + channel tag + tier gating + “flyer landing” + QR), because that single primitive unlocks ~80% of the promotional magic above—exactly the way Posh builds SMS + tracking links into the event workflow. ([Posh Support](#))
