
1. What This MVP Actually Is

This MVP is a **spatial event coordination system**, not a wearable system and not a generic ticketing app.

Think of it as:

“A city-scale 3D event map where access, visibility, and participation are governed by invitation tier and social context—not algorithms.”

So the MVP must prove **four things simultaneously**:

- Events can be created and discovered spatially
- Invitations create real boundaries (not vibes)
- Tickets and shops function without killing the experience
- The system feels *different* from Eventbrite + Instagram duct-taped together

If it doesn't feel different, it fails.

2. The Irreducible MVP Surface Area

Below is the *minimum set of systems* required for this to work as **WeUP**, not a prototype of something else.

A. 3D Map (This Is the Spine)

You do not need photorealism. You need legibility.

MVP Map Requirements

- City-level map (Mapbox / Cesium)
- Stylized, abstracted geometry (blocks, nodes, anchors)
- Events appear as **spatial objects**, not pins
- Time-aware (events fade in/out by time window)
- Zoom layers:
 - City → District → Venue → Event

What the map must communicate

- Where events exist
- Rough scale / intensity
- Whether you *can* access them

What it must not do yet

- Real-time crowds
- Heatmaps
- AR overlays
- Navigation

If the map feels like Google Maps with skins, you've already lost.

B. Event Object Model (Core Domain)

An event in the MVP is **not** a post. It's a container.

Every event must minimally have:

- Location (geo + map anchor)
- Time window
- Visibility scope (public / invite-only / dark)
- Invitation tier requirement
- Ticketing state (free / paid / capacity)
- Optional shop attachment

No comments.

No feeds.

No "likes."

This is deliberate.

C. 3-Tier Invitation System (Hard Gates, Not Social Flair)

This is *non-negotiable* if you want WeUP to be WeUP.

MVP Tiers (example semantics)

- Tier 1 — Public Access
Anyone can see and attend
- Tier 2 — Extended Network
Invite required; visible but locked

- Tier 3 — Private / Dark
Invisible unless invited

What the MVP must support

- Event creators choose tier
- Users hold tiered access tokens (simple DB-backed is fine)
- Invitations are explicit (links, codes, direct grants)
- Tier affects:
 - Event visibility on map
 - Ticket availability
 - Shop visibility

What it must not support yet

- On-chain enforcement
- Reputation scores
- Invite markets

This is about **boundary clarity**, not economics.

D. Event Panel (The Primary UI Surface)

The event panel is the **command center**.

MVP Event Panel Must Include

- Event description (short, intentional)
- Time & location
- Invitation requirements
- Ticket status
- Host identity (minimal)
- Shop tab (if enabled)
- Poster/flyer display

Design constraint

- One screen
- No infinite scroll
- No comments

If users start doomscrolling inside events, you've violated the system's philosophy.

E. Poster & Flyer Upload (Cultural Anchor)

This matters more than it sounds.

MVP Requirements

- Image upload (poster/flyer)
- Appears:
 - On the map (as texture or icon)
 - In the event panel
- Versioned but not socialized (no reactions)

This replaces Instagram as the *visual authority* for the event.

F. Event Ticketing (Minimal but Real)

Ticketing must exist, or events aren't real.

MVP Ticketing

- Free and paid tickets
- Capacity limit
- Simple checkout (Stripe)
- QR or code for validation (later can map to wearables)

No resale.

No speculation.

No dynamic pricing.

Tickets are **permission**, not assets.

G. Shop (Event-Scoped, Not a Marketplace)

The shop must feel *attached*, not global.

MVP Shop Capabilities

- Enabled per event
- Limited SKUs (merch, artist items, passes)
- Visibility tied to invitation tier
- Purchase before or during event

No browsing across events.
No algorithmic recommendations.

The shop is an *extension of presence*, not e-commerce.

3. What You Explicitly Do NOT Build Yet

To keep this an MVP, these must be *absent*:

- Wearables
- Ritual mechanics
- Social feeds
- Messaging
- Following
- Comments
- Likes
- Creator analytics dashboards
- DAO governance
- On-chain ticketing
- AI curation

You are building **a place**, not a platform.

4. MVP Tech Stack (Lean, Honest)

Frontend

- Vue 3 + Quasar
- Mapbox or Cesium
- Single-page, cinematic transitions

Backend

- Python (FastAPI) or .NET Core (either is fine)
- PostgreSQL
- Simple auth (email / magic link)
- Stripe for payments

Data Models You Actually Need

- User

- InvitationToken
- Event
- Ticket
- ShopItem
- Purchase
- MapAnchor

That's it.

5. The MVP Success Test (Read This Carefully)

Your MVP is successful if:

- A host can create an event in under 5 minutes
- A guest can understand *why* they can or cannot see an event
- The map feels like discovery, not search
- Invitations feel meaningful, not spammy
- The shop doesn't feel like Shopify
- The system does **not** encourage constant checking

If people say:

“This feels calmer than other platforms”

You're on the right path.

The Key Insight (Don't Skip This)

You are not building:

- an event app
- a ticketing platform
- a social network

You are building **a spatial permission system for culture.**

Everything in the MVP must serve that—or be cut.

If you want, next we can:

- Collapse this into a **30–60 day build plan**

- Define the **exact screens** (no more, no less)
- Or draft the **event creation flow** line-by-line like a game tutorial
